CURRENT POSTURE Selective Risk

The Selective Risk regime remains the primary operating frame. Index structure, participation, leadership led by Information Technology, and cross-asset proxy evidence should be used together; incomplete confirmation favors selective exposure and explicit invalidation levels.

CONFIRMATION

- Benchmark price holds above medium-term support while participation improves.
- Leadership broadens beyond the current leading groups with confirming volume.

INVALIDATION

- Benchmark price breaks medium-term support while breadth deteriorates.
- Credit and volatility proxies stop confirming the prevailing risk posture.

TODAY'S RESEARCH QUESTION

## Why is Cybersecurity leading, and is participation broad enough to persist?

Cybersecurity is the qualified leading research priority at 63.5/100. Section 6 tests the supporting evidence, counter-evidence, and failure conditions.

CONTENTS

Structure / Participation / Leadership / Research Question / Cross-Asset / Risk / Scenarios / Securities / Operating Plan

Every conclusion is linked to frozen evidence. Missing observations remain missing; relationship arrows encode validated structure, not forecasts.

## 02 EXECUTIVE SUMMARY

### What changed, why does it matter, and where is the evidence incomplete?

Connect structure, participation, leadership, the research question, cross-asset evidence, and risk into one argument.

Baseline established. Structure defines the trend; breadth tests participation; leadership tests concentration; cross-asset proxies provide confirmation or counter-evidence.

Index strength matters more when growth, small-cap, and industrial benchmarks agree. Divergent relative ratios narrow opportunity even when the benchmark holds its range.

Breadth and leadership determine execution quality. Broadening improves breakout reliability; concentrated strength raises entry standards and reduces acceptable size.

Research priority: Cybersecurity is classified leading with a 63.5/100 priority score. Section 6 tests the supporting and contradictory evidence and defines the conditions that would change that classification.

Cross-asset evidence is confirmatory, not causal. Direct yields, credit spreads, and volatility term structure remain unavailable and are not inferred from ETF proxies.

|                    |                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SUPPORTED CLAIM    | The Selective Risk regime remains the primary operating frame. Index structure, participation, leadership led by Information Technology, and cross-asset proxy evidence should be used together; incomplete confirmation favors selective exposure and explicit invalidation levels. |
| INTERPRETATION     | The evidence supports a conditional posture rather than a broad causal conclusion.                                                                                                                                                                                                   |
| TRADER IMPLICATION | Favor setups that confirm on price, participation, and volume; reduce risk when those signals diverge.                                                                                                                                                                               |

#### Evidence-Linked Checklist

| METRIC              | CONDITION                                                | WHY IT MATTERS                                     | ACTION                                                                             |
|---------------------|----------------------------------------------------------|----------------------------------------------------|------------------------------------------------------------------------------------|
| Benchmark structure | Hold qualified medium-term support                       | Tests whether the primary trend remains intact.    | Maintain selective exposure while support holds; reduce risk on a confirmed break. |
| Market breadth      | Short- and medium-horizon participation improve together | Tests whether index strength is broadly supported. | Become more aggressive only as participation broadens.                             |

## 03 MAJOR INDEX STRUCTURE

### Does index structure confirm the current regime?

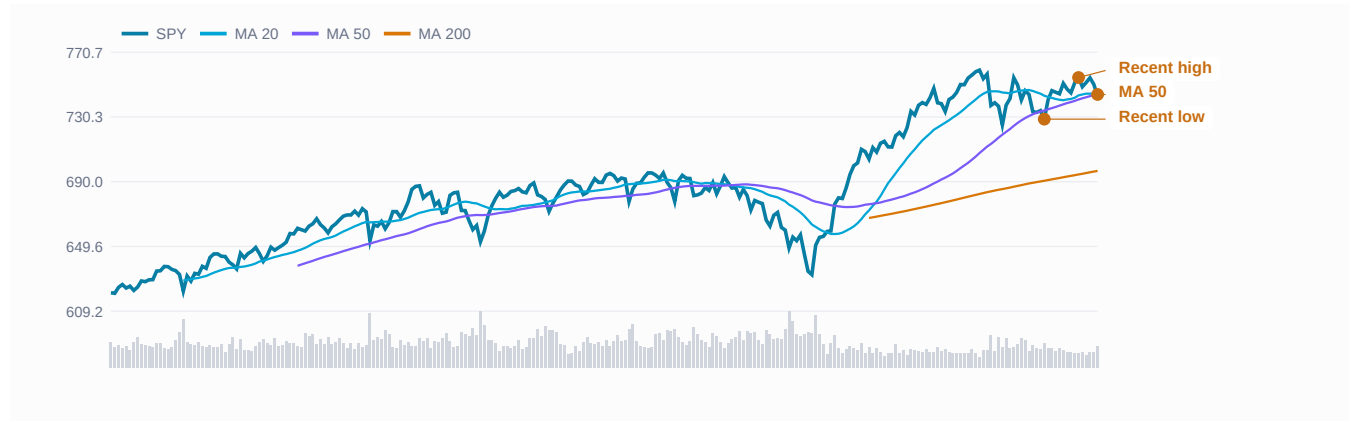

Test trend quality across capitalization and style benchmarks.

Moving averages define observed structure; volume and benchmark ratios test whether index strength extends across styles.

#### Figure 1. SPY Price, Trend and Volume

Adjusted daily observations with qualified moving averages | 260 sessions | As of 2026-07-17

**QUESTION ANSWERED** Is SPY price structure confirming the market thesis?

**Observation.** SPY closed at 743.29, below its 50-day average of 744.38.

**Interpretation.** SPY remains a direct test of the report's market-structure thesis.

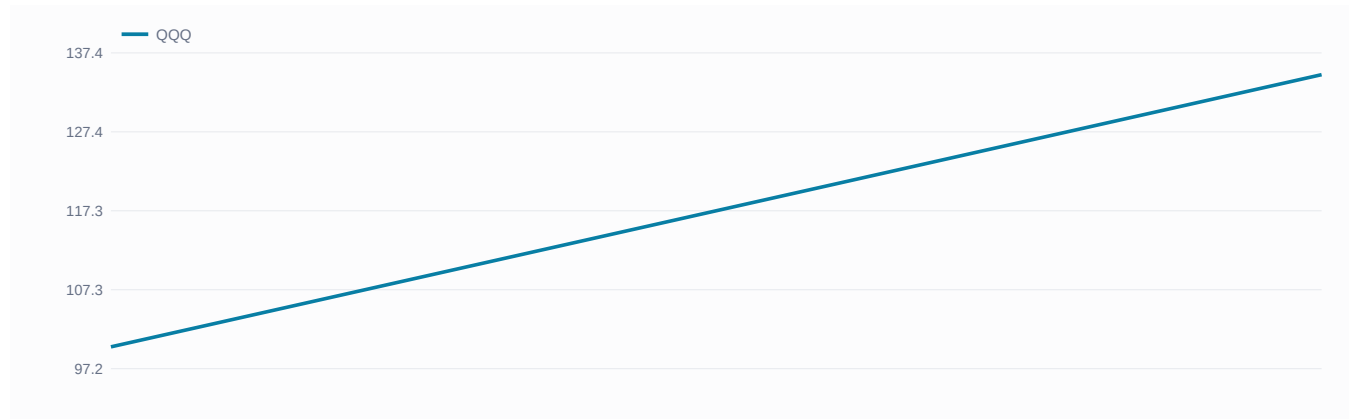

**Confirmation.** A close above the recent swing high with improving participation. **Risk.** A break below the medium-term average with deteriorating breadth.

Source: bars-polygon-spy | Quality: live; 100% complete

#### Figure 2. QQQ Closing-Price Structure

Frozen report history; volume and session labels unavailable | 100 observations | As of 2026-07-21

**QUESTION ANSWERED** Is QQQ closing-price structure stable?

**Observation.** The frozen report contains 100 QQQ closing-price observations.

**Interpretation.** The close-only series supports trend inspection but not volume or event alignment.

**Confirmation.** Durable dated OHLCV would strengthen the structure assessment. **Risk.** Do not infer volume confirmation from this close-only series.

Source: report | Quality: partial; 50% complete

# 03 MAJOR INDEX STRUCTURE

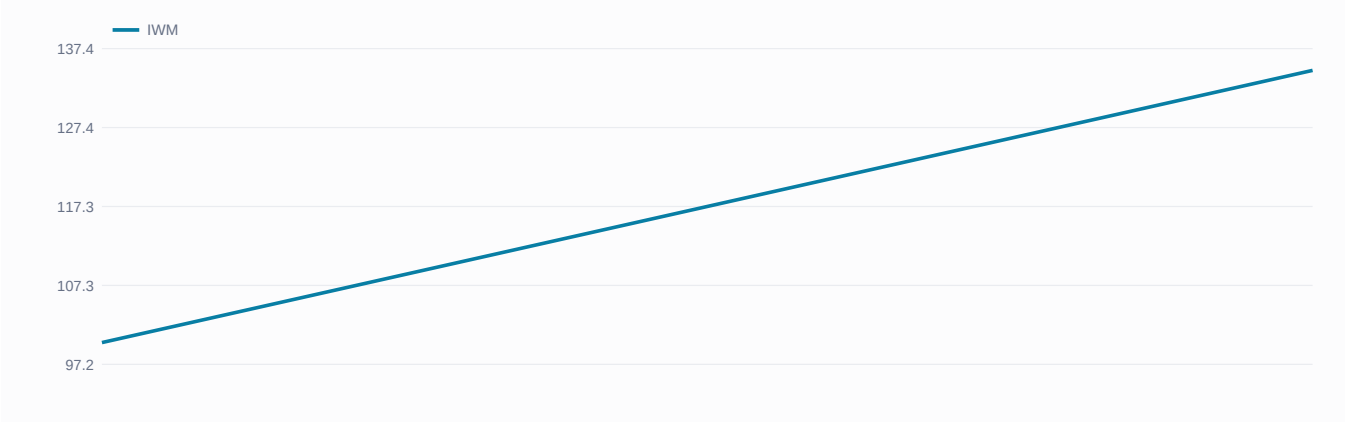

## Does index structure confirm the current regime?

Continued evidence

Figure 3. IWM Closing-Price Structure

Frozen report history; volume and session labels unavailable | 100 observations | As of 2026-07-21

QUESTION ANSWERED Is IWM closing-price structure stable?

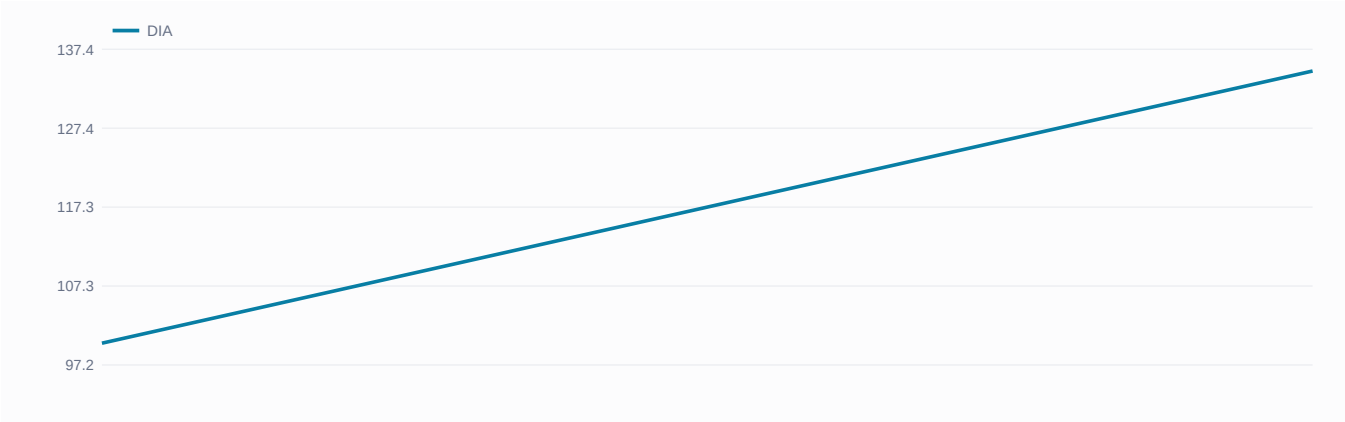

**Observation.** The frozen report contains 100 IWM closing-price observations.  
**Interpretation.** The close-only series supports trend inspection but not volume or event alignment.  
**Confirmation.** Durable dated OHLCV would strengthen the structure assessment. **Risk.** Do not infer volume confirmation from this close-only series.

Source: report | Quality: partial; 50% complete

Figure 4. DIA Closing-Price Structure

Frozen report history; volume and session labels unavailable | 100 observations | As of 2026-07-21

QUESTION ANSWERED Is DIA closing-price structure stable?

**Observation.** The frozen report contains 100 DIA closing-price observations.  
**Interpretation.** The close-only series supports trend inspection but not volume or event alignment.  
**Confirmation.** Durable dated OHLCV would strengthen the structure assessment. **Risk.** Do not infer volume confirmation from this close-only series.

Source: report | Quality: partial; 50% complete

## 04 BREADTH AND PARTICIPATION

### Does breadth confirm the index move?

Determine whether constituent participation confirms benchmark price.

Short-, medium-, and long-horizon participation remain separate. Missing internals stay missing rather than being collapsed into a synthetic breadth label.

#### Evidence-Linked Checklist

| METRIC         | CONDITION                                                | WHY IT MATTERS                                     | ACTION                                                 |
|----------------|----------------------------------------------------------|----------------------------------------------------|--------------------------------------------------------|
| Market breadth | Short- and medium-horizon participation improve together | Tests whether index strength is broadly supported. | Become more aggressive only as participation broadens. |

## 05 LEADERSHIP AND ROTATION

### Which sectors and themes are driving the tape?

Separate established leadership from emerging, weakening, and concentrated moves.

Returns identify persistence, rotation tails show direction, and constituent breadth tests representativeness. A quadrant label alone is insufficient.

#### Evidence-Linked Checklist

| METRIC     | CONDITION                                       | WHY IT MATTERS                                               | ACTION                                                       |
|------------|-------------------------------------------------|--------------------------------------------------------------|--------------------------------------------------------------|
| Leadership | Relative strength and constituent breadth agree | Separates durable leadership from concentrated ETF movement. | Favor groups with both price and participation confirmation. |

#### Figure 5. Sector Leadership Matrix

Multiple horizons; missing observations remain blank | 1 day to 1 year | As of 2026-07-21

QUESTION ANSWERED Where is sector leadership established or weakening?

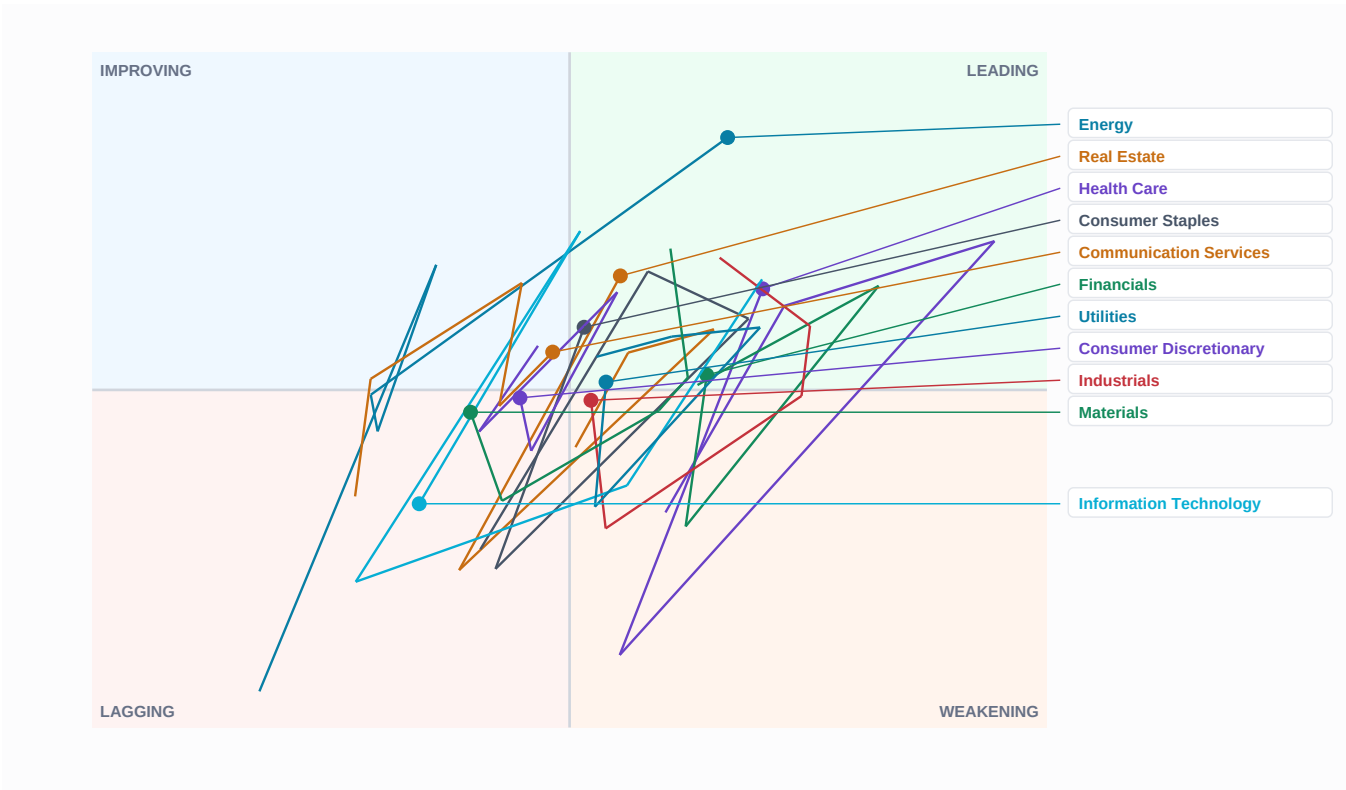

|                        | 1D    | 1W    | 1M    | 3M     | 6M     | 1Y     |
|------------------------|-------|-------|-------|--------|--------|--------|
| Information Technology | +0.4% | +2.0% | +8.0% | +14.4% | +20.0% | +25.6% |
| Industrials            | +0.1% | +0.2% | +1.0% | +1.8%  | +2.5%  | +3.2%  |
| Utilities              | -0.2% | -1.2% | -5.0% | -9.0%  | -12.5% | -16.0% |

**Observation.** The return matrix separates short-term movement from persistent multi-horizon leadership.  
**Interpretation.** Leadership is more robust when relative performance and internal breadth agree across horizons.  
**Confirmation.** Improving returns accompanied by stronger sector breadth would confirm sustainable rotation. **Risk.** Strong ETF returns with weak constituent participation would indicate concentration risk.

Source: sector-snapshot | Quality: partial; 27% complete

Figure 6. Sector Rotation with Tails

One-month relative-return momentum versus SPY | 1 month | As of 2026-07-17  
QUESTION ANSWERED Which sectors are gaining relative strength and momentum?

**Observation.** Rotation tails show direction and persistence rather than only the latest quadrant.  
**Interpretation.** Movement toward stronger relative performance and momentum provides confirmation; quadrant position alone is insufficient.  
**Confirmation.** A sustained improving-to-leading path with qualifying sector breadth. **Risk.** A leading-to-weakening path accompanied by deteriorating participation.

Source: sector-rotation | Quality: live; 100% complete

## 06 RESEARCH QUESTION

### Why is Cybersecurity leading, and is participation broad enough to persist?

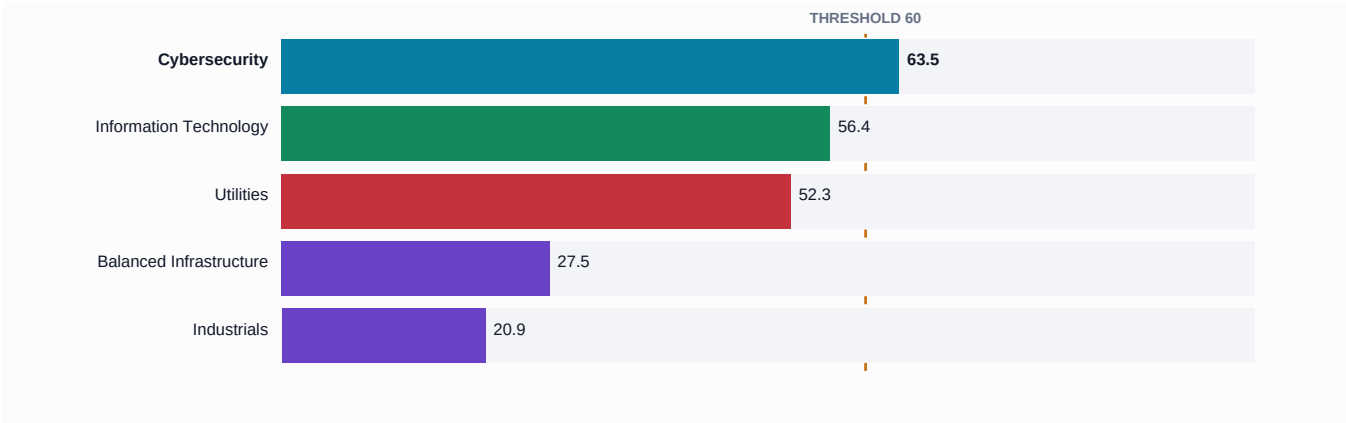

Answer one material market question with explicit evidence, counter-evidence, relationships, continuity, and decision conditions.

|                                              |           |                                                                                                                                                                                                                                                                                                                                                 |                                                |              |             |
|----------------------------------------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|--------------|-------------|
| EXECUTIVE ANSWER                             |           | Cybersecurity qualifies as leading: priority 63.5 exceeds the 60.0 gate, one-month benchmark-relative strength is +11.0, and directional persistence is high. Breadth confirms broad participation; the conclusion remains conditional because group-level volume confirmation is unavailable; missing evidence does not count as confirmation. |                                                |              |             |
| OVERALL                                      | FRESHNESS | BREADTH                                                                                                                                                                                                                                                                                                                                         | PARTICIPATION                                  | COMPLETENESS | CONSISTENCY |
| High                                         | High      | High                                                                                                                                                                                                                                                                                                                                            | High                                           | High         | High        |
| RELATIVE LEADERS                             |           |                                                                                                                                                                                                                                                                                                                                                 | RELATIVE LAGGARDS                              |              |             |
| ZS   1M return 19.0<br>FTNT   1M return 18.0 |           |                                                                                                                                                                                                                                                                                                                                                 | CRWD   1M return 16.0<br>PANW   1M return 17.0 |              |             |

Figure 7. Research Priority Tree

Fixed-weight materiality score across deterministic candidates | Current report | As of 2026-07-21

QUESTION ANSWERED Why did this subject outrank competing research candidates?

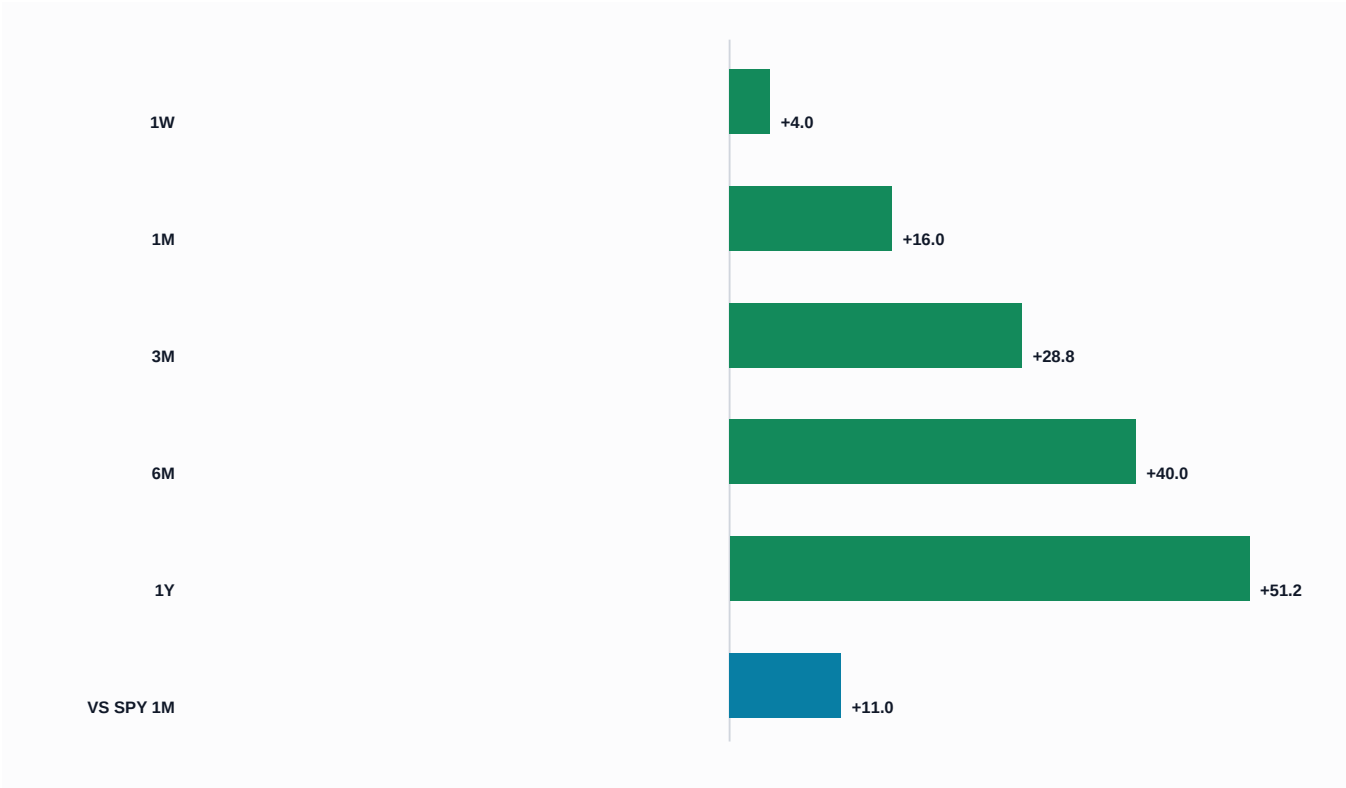

**Observation.** Cybersecurity ranks first among qualified candidates at 63.5.  
**Interpretation.** The comparison combines market significance, directional magnitude, change, persistence, participation, divergence, user relevance, completeness and freshness; missing volume contributes zero rather than a synthetic confirmation.  
**Confirmation.** The subject remains above the materiality threshold as its market and participation evidence persists. **Risk.** A lower score or a freshness, completeness, constituent, or figure gate failure removes the standalone focus.

Source: research-theme | Quality: live; 100% complete

Figure 8. Cybersecurity Relative Strength Flow

Multi-period returns plus the supported one-month benchmark-relative reading | 1 week to 1 year | As of 2026-07-21  
QUESTION ANSWERED Is the subject's direction recent, persistent, and distinct from the benchmark?

**Observation.** Cybersecurity has 6 supported return horizons for persistence review.  
**Interpretation.** Agreement across horizons supports persistence; disagreement identifies an emerging, fading, or unstable move.  
**Confirmation.** The next snapshot preserves directional agreement and market-relative strength. **Risk.** Short-horizon reversal followed by weaker medium-horizon evidence would reduce persistence.

Source: research-theme | Quality: live; 100% complete

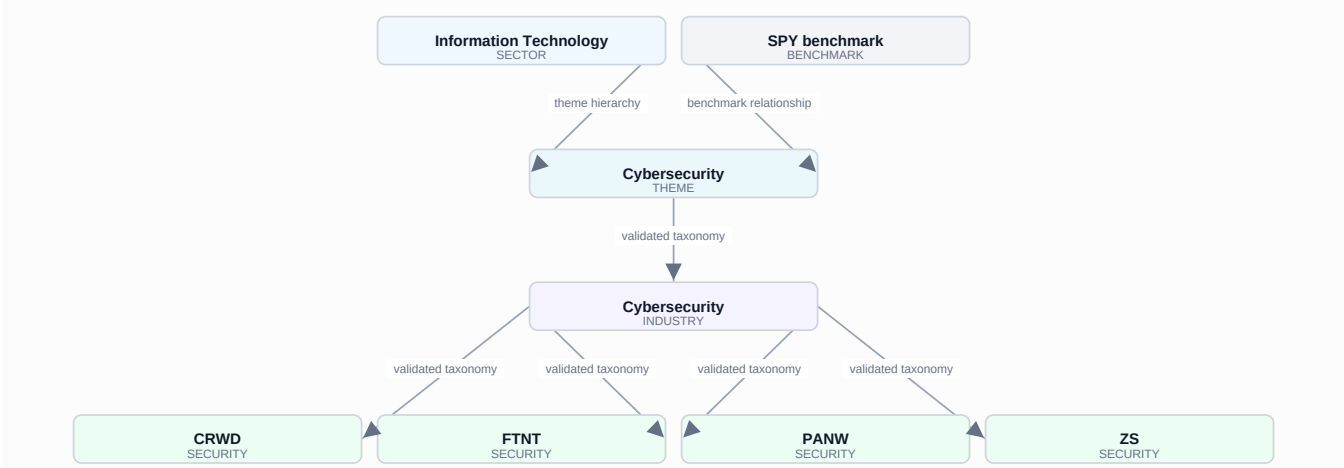

## 06 RESEARCH QUESTION

### Why is Cybersecurity leading, and is participation broad enough to persist?

Continued evidence

Figure 9. Research Chain

Branching map of benchmark, taxonomy, membership, and saved-watchlist relationships | Current validated mappings | As of 2026-07-21  
**QUESTION ANSWERED** How does validated structure connect the research subject to industries, securities, and the user's saved list?

**Observation.** 8 nodes are connected by 7 explicit validated relationships.  
**Interpretation.** Arrows encode taxonomy, benchmark, membership, or saved-overlap relationships; they do not forecast price direction or imply causality.  
**Confirmation.** The chain remains valid while the underlying taxonomy and saved-item mappings remain current. **Risk.** Missing or unstructured mappings are omitted; supplier/customer links require a separate structured source.

Source: research-theme | Quality: live; 100% complete

Figure 10. Evidence Matrix

Supports, neutral, and contradicts classification for the primary thesis | Current report | As of 2026-07-21  
**QUESTION ANSWERED** Which evidence supports the answer, and where is confirmation incomplete?

| DIMENSION               | FINDING / IMPLICATION                                                                                                                                                                                | SUPPORTS | NEUTRAL | CONTRADICTS |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|---------|-------------|
| Relative performance    | One-month benchmark-relative evidence is +11.0 points and is evaluated in the positive thesis direction. Separation from the benchmark determines whether the signal is more than broad-market beta. | ●        | ●       | ●           |
| Persistence             | The supported 1W/1M/3M profile produces a directional-persistence reading of +100.0%. Cross-horizon agreement supports durability; disagreement identifies an emerging or fading move.               | ●        | ●       | ●           |
| Breadth                 | Constituent breadth is +94.0%; the directional confirmation score is +94.0. Participation by more constituents reduces concentration risk; narrow breadth limits conviction.                         | ●        | ●       | ●           |
| Change and acceleration | Rank, relative-strength, breadth, and classification changes produce an acceleration reading of unavailable. A changing signal deserves more research attention than a static trailing rank.         | ●        | ●       | ●           |
| Volume participation    | No distinct group-level volume confirmation is available. Missing volume cannot confirm the thesis and contributes zero to priority scoring.                                                         | ●        | ●       | ●           |
| User relevance          | Personal relevance is low; 0 saved securities have validated overlap. Personalization changes research priority, not the underlying market conclusion.                                               | ●        | ●       | ●           |

**Observation.** 6 evidence dimensions are classified against the thesis.  
**Interpretation.** Neutral evidence is not treated as support, and missing observations are not converted into synthetic confirmation.  
**Confirmation.** More dimensions move to Supports through fresh, directionally consistent evidence. **Risk.** Contradictory breadth, persistence, or benchmark-relative evidence would weaken the answer.

Source: research-theme | Quality: live; 100% complete

## 06 RESEARCH QUESTION

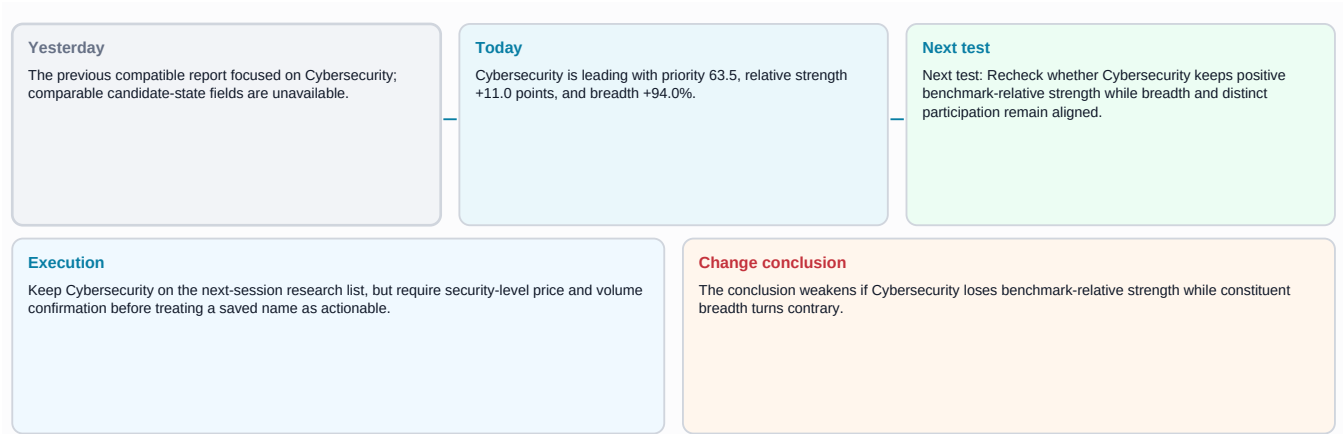

### Why is Cybersecurity leading, and is participation broad enough to persist?

Continued evidence

Figure 11. Research Evolution and Decision Framework

Yesterday to today, then the evidence test that governs the next update | Previous report to next compatible observation | As of 2026-07-21

QUESTION ANSWERED What changed, what should be monitored, and what changes the conclusion?

**Observation.** No compatible change fields are available; the current observation is treated as a baseline.  
**Interpretation.** The next step is framed as an evidence test, not a price forecast.  
**Confirmation.** Directional relative strength persists on the next compatible snapshot. **Risk.** A contradictory compatible snapshot would trigger the explicit change-conclusion rule shown above.

Source: research-theme | Quality: live; 100% complete

## 07 CROSS-ASSET AND MACRO CONFIRMATION

### Do cross-asset proxies confirm the equity posture?

Test whether supported market proxies agree with the equity posture and selected research subject.

Adjusted ETF prices are aligned as observational proxies. Treasury and high-yield ETFs are not direct yields or credit spreads, and no causal transmission is asserted.

## 08 RISK, VOLATILITY, CREDIT AND SENTIMENT

### What could destabilize the thesis?

Describe current risk and its direction using available history.

Compatible report history supplies direction; unavailable volatility term structure and spread series remain disclosed gaps.

The primary risk is joint deterioration in benchmark structure and participation. Point-in-time sentiment cannot replace price, breadth, and cross-asset confirmation.

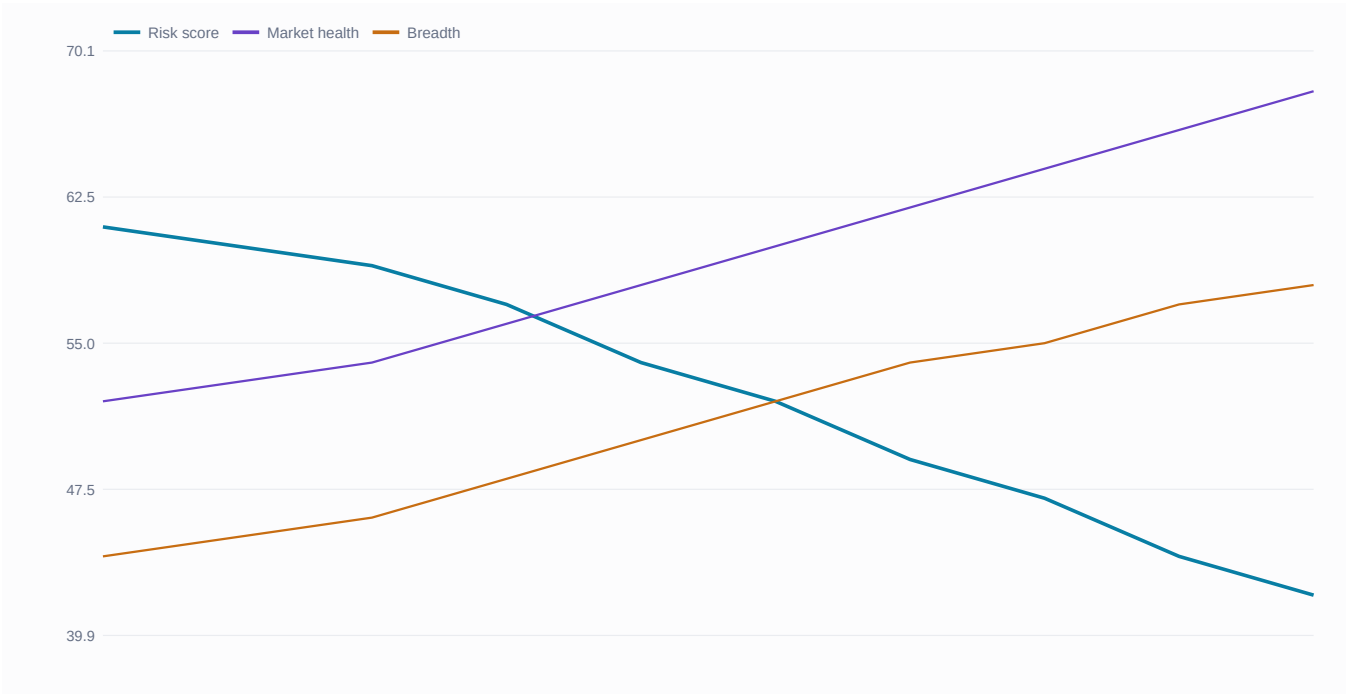

|                    |                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| SUPPORTED CLAIM    | Current risk, sentiment, and participation are evaluated as separate observations; disagreement between them is treated as counter-evidence. |
| INTERPRETATION     | A point-in-time score needs historical direction and cross-signal confirmation before it can support a stronger conclusion.                  |
| TRADER IMPLICATION | Keep position size conditional on benchmark support and participation rather than relying on a single risk score.                            |

Evidence-Linked Checklist

| METRIC       | CONDITION                                               | WHY IT MATTERS                                                 | ACTION                                           |
|--------------|---------------------------------------------------------|----------------------------------------------------------------|--------------------------------------------------|
| Risk proxies | Credit and defensive proxies do not contradict equities | Provides cross-asset confirmation without asserting causality. | Reduce size when cross-asset disagreement grows. |

Figure 12. Risk and Market-Health History

Compatible immutable report observations | 10 reports | As of 2026-07-21  
QUESTION ANSWERED Is the risk posture improving or deteriorating?

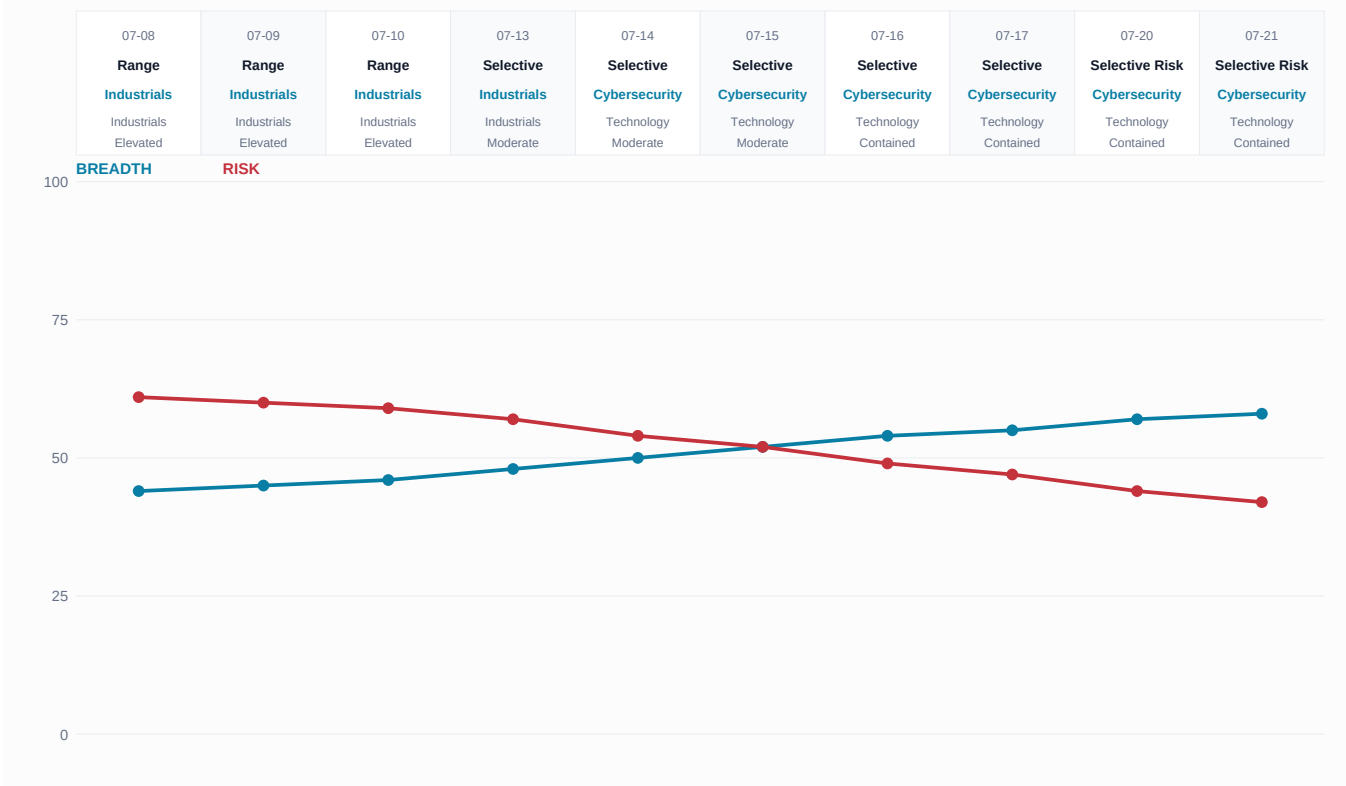

**Observation.** The available history shows direction across compatible report-level risk measures.  
**Interpretation.** A shallow history is context, not a long-run distribution.  
**Confirmation.** Improving health with stable or falling risk would confirm the posture. **Risk.** Rising risk with falling health would weaken the thesis.

Figure 13. Research Timeline

Regime, breadth, leadership, risk, volatility and research focus across compatible reports | 10 reports | As of 2026-07-21

QUESTION ANSWERED How has the market thesis and research priority evolved across the last ten compatible reports?

**Observation.** 10 compatible report observations are available; unavailable fields remain blank.  
**Interpretation.** The timeline shows sequencing across supported market-state and research fields without filling missing history.  
**Confirmation.** Improving health and breadth with contained risk would confirm a stronger market state. **Risk.** Rising risk or deteriorating breadth ahead of index weakness would increase caution.

## 09 SCENARIO FRAMEWORK AND EVENTS

### Which evidence would move the market into a different path?

Translate prior evidence into conditional market paths and include only sourced events.

Paths use qualitative labels, not unsupported probabilities. Each one identifies conditions, invalidation, leadership, and operating response from evidence already introduced.

| PATH                                         | REQUIRED CONDITIONS                                                                                                                                                                                                                                                            | OPERATING RESPONSE                                                                                                                               | INVALIDATION                                                                                                                                                                                                                                                           |

## 10 PERSONALIZED WATCHLIST AND SECURITY RESEARCH

### Which saved securities deserve deeper research?

Prioritize saved-security monitoring without promoting stale or partial evidence.

No frozen saved-security records are available for selected-security research. No mini report or substitute security is generated.

# 11 NEXT-SESSION OPERATING PLAN

## What must be confirmed or invalidated next session?

Convert the thesis and Research Focus into explicit monitoring and risk conditions.

Every condition links a metric to its rationale and action implication; none substitutes for personalized investment advice.

### Evidence-Linked Checklist

| METRIC                       | CONDITION                                                                                                                                               | WHY IT MATTERS                                                                                  | ACTION                                                                                                        |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| Benchmark structure          | Hold qualified medium-term support                                                                                                                      | Tests whether the primary trend remains intact.                                                 | Maintain selective exposure while support holds; reduce risk on a confirmed break.                            |
| Market breadth               | Short- and medium-horizon participation improve together                                                                                                | Tests whether index strength is broadly supported.                                              | Become more aggressive only as participation broadens.                                                        |
| Leadership                   | Relative strength and constituent breadth agree                                                                                                         | Separates durable leadership from concentrated ETF movement.                                    | Favor groups with both price and participation confirmation.                                                  |
| Risk proxies                 | Credit and defensive proxies do not contradict equities                                                                                                 | Provides cross-asset confirmation without asserting causality.                                  | Reduce size when cross-asset disagreement grows.                                                              |
| Cybersecurity Research Focus | Directional relative strength persists on the next compatible snapshot.; Constituent breadth and distinct participation remain aligned with leadership. | Tests whether the selected leading subject retains relative-strength and participation support. | Upgrade monitoring only if confirmation persists; downgrade it when any listed invalidation condition occurs. |

# 12 METHODOLOGY, SOURCES AND LIMITATIONS

## How strong and auditable is the evidence?

Make provenance, transformations, research selection and unavailable evidence auditable.

Interpretations derive from the frozen evidence registry. Figures carry sources, timestamps, quality states, and explicit omissions.

### Research Focus Selection

| FIELD                    | RESEARCH FOCUS SELECTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Subject / classification | Cybersecurity   theme / leading                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Data Limitations

- Breadth history figures omitted because the referenced immutable BreadthSnapshot is unavailable.
- Direct Treasury yield and yield-curve histories are unavailable; ETF bond prices are labelled as proxies.
- High-yield and investment-grade spread histories are unavailable; HYG is labelled as a price proxy.
- IWM/SPY ratio omitted because aligned durable history is insufficient.
- No external research URLs, validated causal-attribution model, or historical analogues are available.
- Normalized cross-asset proxy figure omitted because fewer than two durable series qualify.
- QQQ/SPY ratio omitted because aligned durable history is insufficient.
- Security research is abbreviated because the frozen watchlist is empty.
- Theme histories use the current reviewed basket unless a versioned historical membership record exists.
- Unsourced economic and earnings event strings are excluded from V7.
- VIX history and term structure are unavailable as durable sourced series.
